

Saving Energy Takes More Than a Dimmer

Raising the shades and turning off the lights doesn't save energy if the room is hot and the air conditioning runs all day. Or when a meeting ends, everyone leaves the room, but the projector and other AV devices stay on. The dimmer doesn't know about room schedules, temperature and other AV equipment that consume electricity and drive energy costs through the roof.

Only Crestron Green Light™ provides commercial lighting and intelligent building management solutions to deliver real energy savings. Centrally and locally monitor every circuit using award-winning Crestron software and touchpanels. All building technology and environmental systems, including HVAC, sprinklers and security, are also connected through and managed by the Crestron control system to maximize efficiency. Offer your clients a true energy solution. Crestron Green Light delivers up to 30% real cost savings in the first year alone. **That's green you can take to the bank.**
